

ABSTRACT

A wall mounted protective guard is located below a wall switch, alarm pull box station, thermostat or the like to prevent damage, inadvertent operation or actuation of the device. In the preferred embodiment the guard is a curved member located adjacent and below the device in order to receive and deflect objects that otherwise would contact the device. The guard may have a reflective feature to allow the switch or like device to be located in dark or emergency situations. The guard allows for full access to wall mounted devices by individuals having limited range of motion or disabilities.
